

Package ‘predriskXGB’

May 6th, 2025

Title Inferring risk of G3 oligodendroglioma patients from morphometric feature data using survival XGBoost models

Version 1.0

Description The predriskXGB package contains a collection of trained models and wrapper functions that facilitate their use

URL <https://github.com/diamandis-lab/predriskXGB>

Depends R (>= 4.4.0)

Imports survXgboost, xgboost, survminer, survival, ggplot2

Encoding UTF-8

Language en-US

Author Anzar Alvi [aut]

R topics documented

predRiskXGB 2

predRiskXGB

predRiskXGB*Returns risk score from testing data*

Description

`predRiskXGB()` takes ‘test’, ‘model_family’, and ‘index’ and infers risk of the testing data from the model at the specified index from model_family.

Usage

```
predRiskXGB(test, model_family, index)
```

Arguments

testing	Output from <code>read.csv()</code> function which reads in testing data from a .csv file
model_family	Parameter that lets the specify the family of models to be used (string)
index	The index number into the list of models in ‘model_family’ (integer)

Examples

```
testing_data <- read.csv('testing_data.csv')
predRiskXGB(testing_data, 'g3oligo', 18)
```
